	Python Module Index	67
	Index	69

ADB SETUP

This package works by sending ADB commands to your Android TV / Fire TV device. There are two ways to accomplish this.

1.1 1. ADB Server

androidtv can use a running ADB server to send ADB commands (credit: [pure-python-adb](#)). More info about ADB can be found here: [Android Debug Bridge \(adb\)](#). There are 3 main ways to setup an ADB server.

Note: The ADB server must be connected to your device(s) before starting Home Assistant. Otherwise, the components will not be setup.

1.1.1 1a) Hass.io ADB Addon

For Hass.io users, this is the easiest option. Information about the addon can be found here: [Community Hass.io Add-ons: Android Debug Bridge](#). The configuration for the addon will look like:

```
{
  "log_level": "info",
  "devices": [
    "192.168.0.111",
    "192.168.0.222"
  ],
  "reconnect_timeout": 90,
  "keys_path": "/config/.android"
}
```

Your Home Assistant configuration will look like:

```
media_player:
- platform: androidtv
  name: Android TV 1
  host: 192.168.0.111
  adb_server_ip: 127.0.0.1

media_player:
- platform: androidtv
  name: Android TV 2
```

(continues on next page)

(continued from previous page)

```
host: 192.168.0.222
adb_server_ip: 127.0.0.1
```

1.1.2 1b) Docker Container

Since Home Assistant isn't able to start the connection with the Android device directly, the ADB Server must do it instead. The ADB Server **must already be connected** to the Android device when Home Assistant attempts to access the ADB Server, or else Home Assistant will be unable to set up the Android device.

A modified script provided on the Home Assistant forums ([source](#)) demonstrates an example startup script for a Docker container that will automatically attempt, and continue to connect to a device when run:

Listing 1: `startup.sh`

```
#!/bin/sh

# for a single device, use: DEVICES=("192.168.0.111")
DEVICES=("192.168.0.111" "192.168.0.222")

echo "Starting up ADB..."

while true; do
  adb -a server nodaemon > /dev/null 2>&1
  sleep 10
done &

echo "Server started. Waiting for 30 seconds..."
sleep 30

echo "Connecting to devices."
for device in ${DEVICES[@]}; do
  adb connect $device
done
echo "Done."

while true; do
  for device in ${DEVICES[@]}; do
    adb connect $device > /dev/null 2>&1
  done
  sleep 60
done
```

Assuming the address of the ADB server is 192.168.0.101, your Home Assistant configuration will look like:

```
media_player:
- platform: androidtv
  name: Android TV 1
  host: 192.168.0.111
  adb_server_ip: 192.168.0.101

media_player:
- platform: androidtv
```

(continues on next page)

(continued from previous page)

```

name: Android TV 2
host: 192.168.0.222
adb_server_ip: 192.168.0.101

```

1.1.3 1c) Linux Service

TODO

Your Home Assistant configuration will look like:

```

media_player:
- platform: androidtv
  name: Android TV 1
  host: 192.168.0.111
  adb_server_ip: 127.0.0.1

media_player:
- platform: androidtv
  name: Android TV 2
  host: 192.168.0.222
  adb_server_ip: 127.0.0.1

```

1.2 2. Python ADB Implementation

The second way that androidtv can communicate with devices is using the Python ADB implementation (credit: [adb-shell](#)).

If your device requires ADB authentication, you will need to follow the instructions in the “ADB Authentication” section below. Once you have an authenticated key, this approach does not require any additional setup or addons. However, users with newer devices may find that the ADB connection is unstable. For a Fire TV device, you can try setting the `get_sources` configuration option to `false`. If the problem cannot be resolved, you should use the ADB server option.

Assuming you have 2 devices that require authentication, your configuration will look like this (update the `adbkey` path accordingly):

```

media_player:
- platform: androidtv
  name: Android TV 1
  host: 192.168.0.111
  adbkey: "/config/.android/adbkey"

media_player:
- platform: androidtv
  name: Android TV 2
  host: 192.168.0.222
  adbkey: "/config/.android/adbkey"

```

1.2.1 ADB Authentication

If you get a “Device authentication required, no keys available” error when trying to set up your Android TV or Fire TV, then you’ll need to create an adbkey and add its path to your configuration. Follow the instructions on this page to connect to your device from your computer: [Connecting to Fire TV Through adb](#).

Note: In the dialog appearing on your Android TV / Fire TV, you must check the box that says “always allow connections from this device.” ADB authentication in Home Assistant will only work using a trusted key.

Once you’ve successfully connected to your Android TV / Fire TV via the command `adb connect <ipaddress>`, the file `adbkey` will be created on your computer. The default location for this file is (from <https://developer.android.com/studio/command-line/adb>):

- Linux and Mac: `$HOME/.android`
- Windows: `%userprofile%\android`

Copy the `adbkey` file to your Home Assistant folder and add the path to your configuration.

ANDROIDTV

2.1 androidtv package

2.1.1 Subpackages

androidtv.adb_manager package

Submodules

androidtv.adb_manager.adb_manager_async module

Classes to manage ADB connections.

- [*ADBPythonAsync*](#) utilizes a Python implementation of the ADB protocol.
- [*ADBServerAsync*](#) utilizes an ADB server to communicate with the device.

class `androidtv.adb_manager.adb_manager_async.ADBPythonAsync(host, port, adbkey="", signer=None)`

Bases: `object`

A manager for ADB connections that uses a Python implementation of the ADB protocol.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **adbkey** (*str*) – The path to the adbkey file for ADB authentication
- **signer** (*PythonRSASigner, None*) – The signer for the ADB keys, as loaded by [*ADBPythonAsync.load_adbkey\(\)*](#)

property available

Check whether the ADB connection is intact.

Returns

Whether or not the ADB connection is intact

Return type

`bool`

async `close()`

Close the ADB socket connection.

async connect(*log_errors=True, auth_timeout_s=10.0, transport_timeout_s=1.0*)

Connect to an Android TV / Fire TV device.

Parameters

- **log_errors** (*bool*) – Whether errors should be logged
- **auth_timeout_s** (*float*) – Authentication timeout (in seconds)
- **transport_timeout_s** (*float*) – Transport timeout (in seconds)

Returns

Whether or not the connection was successfully established and the device is available

Return type

bool

async static load_adbkey(*adbkey*)

Load the ADB keys.

Parameters

adbkey (*str*) – The path to the adbkey file for ADB authentication

Returns

The PythonRSASigner with the key files loaded

Return type

PythonRSASigner

async pull(*local_path, device_path*)

Pull a file from the device using the Python ADB implementation.

Parameters

- **local_path** (*str*) – The path where the file will be saved
- **device_path** (*str*) – The file on the device that will be pulled

async push(*local_path, device_path*)

Push a file to the device using the Python ADB implementation.

Parameters

- **local_path** (*str*) – The file that will be pushed to the device
- **device_path** (*str*) – The path where the file will be saved on the device

async screencap()

Take a screenshot using the Python ADB implementation.

Returns

The screencap as a binary .png image

Return type

bytes

async shell(*cmd*)

Send an ADB command using the Python ADB implementation.

Parameters

cmd (*str*) – The ADB command to be sent

Returns

The response from the device, if there is a response

Return type

str, None

```
class androidtv.adb_manager.adb_manager_async.ADBServerAsync(host, port=5555, adb_server_ip="",  
                                                           adb_server_port=5037)
```

Bases: object

A manager for ADB connections that uses an ADB server.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **adb_server_ip** (*str*) – The IP address of the ADB server
- **adb_server_port** (*int*) – The port for the ADB server

property available

Check whether the ADB connection is intact.

Returns

Whether or not the ADB connection is intact

Return type

bool

async close()

Close the ADB server socket connection.

Currently, this doesn't do anything except set `self._available = False`.**async connect(log_errors=True)**

Connect to an Android TV / Fire TV device.

Parameters

- **log_errors** (*bool*) – Whether errors should be logged

Returns

Whether or not the connection was successfully established and the device is available

Return type

bool

async pull(local_path, device_path)

Pull a file from the device using an ADB server.

Parameters

- **local_path** (*str*) – The path where the file will be saved
- **device_path** (*str*) – The file on the device that will be pulled

async push(local_path, device_path)

Push a file to the device using an ADB server.

Parameters

- **local_path** (*str*) – The file that will be pushed to the device
- **device_path** (*str*) – The path where the file will be saved on the device

async screencap()

Take a screenshot using an ADB server.

Returns

The screencap as a binary .png image, or None if there was an `IndexError` exception

Return type

bytes, None

async shell(cmd)

Send an ADB command using an ADB server.

Parameters

cmd (*str*) – The ADB command to be sent

Returns

The response from the device, if there is a response

Return type

str, None

```
class androidtv.adb_manager.adb_manager_async.AdbDeviceUsbAsync(serial=None, port_path=None, de-  
fault_transport_timeout_s=None, banner=None)
```

Bases: object

An async wrapper for the adb-shell `AdbDeviceUsb` class.

property available

Whether or not an ADB connection to the device has been established.

async close()

Close the connection via the provided transport's `close()` method.

```
async connect(rsa_keys=None, transport_timeout_s=None, auth_timeout_s=10.0, read_timeout_s=10.0, auth_callback=None)
```

Establish an ADB connection to the device.

```
async pull(device_path, local_path, progress_callback=None, transport_timeout_s=None, read_timeout_s=10.0)
```

Pull a file from the device.

```
async push(local_path, device_path, st_mode=33272, mtime=0, progress_callback=None, transport_timeout_s=None, read_timeout_s=10.0)
```

Push a file or directory to the device.

```
async shell(command, transport_timeout_s=None, read_timeout_s=10.0, timeout_s=None, decode=True)
```

Send an ADB shell command to the device.

```
class androidtv.adb_manager.adb_manager_async.ClientAsync(host, port)
```

Bases: object

An async wrapper for the pure-python-adb `Client` class.

async device(serial)

Get a `DeviceAsync` instance.

class androidtv.adb_manager.adb_manager_async.**DeviceAsync**(*device*)

Bases: object

An async wrapper for the pure-python-adb Device class.

async pull(*device_path*, *local_path*)

Download a file.

async push(*local_path*, *device_path*)

Upload a file.

async screencap()

Take a screencap.

async shell(*cmd*)

Send a shell command.

androidtv.adb_manager.adb_manager_async.**_acquire**(*lock*, *timeout=3.0*)

Handle acquisition and release of an `asyncio.Lock` object with a timeout.

Parameters

- **lock** (*asyncio.Lock*) – The lock that we will try to acquire
- **timeout** (*float*) – The timeout in seconds

Yields

acquired (*bool*) – Whether or not the lock was acquired

Raises

[`LockNotAcquiredException`](#) – Raised if the lock was not acquired

androidtv.adb_manager.adb_manager_sync module

Classes to manage ADB connections.

- [`ADBPythonSync`](#) utilizes a Python implementation of the ADB protocol.
- [`ADBServerSync`](#) utilizes an ADB server to communicate with the device.

class androidtv.adb_manager.adb_manager_sync.**ADBPythonSync**(*host*, *port*, *adbkey=""*, *signer=None*)

Bases: object

A manager for ADB connections that uses a Python implementation of the ADB protocol.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **adbkey** (*str*) – The path to the adbkey file for ADB authentication
- **signer** (*PythonRSASigner*, *None*) – The signer for the ADB keys, as loaded by [`ADBPythonSync.load_adbkey\(\)`](#)

property available

Check whether the ADB connection is intact.

Returns

Whether or not the ADB connection is intact

Return type

bool

close()

Close the ADB socket connection.

connect(*log_errors=True, auth_timeout_s=10.0, transport_timeout_s=1.0*)

Connect to an Android TV / Fire TV device.

Parameters

- **log_errors** (*bool*) – Whether errors should be logged
- **auth_timeout_s** (*float*) – Authentication timeout (in seconds)
- **transport_timeout_s** (*float*) – Transport timeout (in seconds)

Returns

Whether or not the connection was successfully established and the device is available

Return type

bool

static load_adbkey(*adbkey*)

Load the ADB keys.

Parameters

adbkey (*str*) – The path to the adbkey file for ADB authentication

Returns

The PythonRSASigner with the key files loaded

Return type

PythonRSASigner

pull(*local_path, device_path*)

Pull a file from the device using the Python ADB implementation.

Parameters

- **local_path** (*str*) – The path where the file will be saved
- **device_path** (*str*) – The file on the device that will be pulled

push(*local_path, device_path*)

Push a file to the device using the Python ADB implementation.

Parameters

- **local_path** (*str*) – The file that will be pushed to the device
- **device_path** (*str*) – The path where the file will be saved on the device

screencap()

Take a screenshot using the Python ADB implementation.

Returns

The screencap as a binary .png image

Return type

bytes

shell(*cmd*)

Send an ADB command using the Python ADB implementation.

Parameters

cmd (*str*) – The ADB command to be sent

Returns

The response from the device, if there is a response

Return type

str, None

class androidtv.adb_manager.adb_manager_sync.**ADBServerSync**(*host*, *port*=5555, *adb_server_ip*="",
adb_server_port=5037)

Bases: object

A manager for ADB connections that uses an ADB server.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **adb_server_ip** (*str*) – The IP address of the ADB server
- **adb_server_port** (*int*) – The port for the ADB server

property available

Check whether the ADB connection is intact.

Returns

Whether or not the ADB connection is intact

Return type

bool

close()

Close the ADB server socket connection.

Currently, this doesn't do anything except set `self._available = False`.

connect(log_errors=True)

Connect to an Android TV / Fire TV device.

Parameters

log_errors (*bool*) – Whether errors should be logged

Returns

Whether or not the connection was successfully established and the device is available

Return type

bool

pull(local_path, device_path)

Pull a file from the device using an ADB server.

Parameters

- **local_path** (*str*) – The path where the file will be saved
- **device_path** (*str*) – The file on the device that will be pulled

push(*local_path*, *device_path*)

Push a file to the device using an ADB server.

Parameters

- **local_path** (*str*) – The file that will be pushed to the device
- **device_path** (*str*) – The path where the file will be saved on the device

screenshot()

Take a screenshot using an ADB server.

Returns

The screenshot as a binary .png image, or None if there was an `IndexError` exception

Return type

bytes, None

shell(*cmd*)

Send an ADB command using an ADB server.

Parameters

cmd (*str*) – The ADB command to be sent

Returns

The response from the device, if there is a response

Return type

str, None

`androidtv.adb_manager.adb_manager_sync.LOCK_KWARGS = {'timeout': 3.0}`

Use a timeout for the ADB threading lock if it is supported

`androidtv.adb_manager.adb_manager_sync._acquire(lock)`

Handle acquisition and release of a `threading.Lock` object with `LOCK_KWARGS` keyword arguments.

Parameters

lock (*threading.Lock*) – The lock that we will try to acquire

Yields

acquired (*bool*) – Whether or not the lock was acquired

Raises

[`LockNotAcquiredException`](#) – Raised if the lock was not acquired

Module contents

androidtv.androidtv package

Submodules

androidtv.androidtv.androidtv_async module

Communicate with an Android TV device via ADB over a network.

ADB Debugging must be enabled.

```
class androidtv.androidtv.androidtv_async.AndroidTVAsync(host, port=5555, adbkey="",
                                                         adb_server_ip="",
                                                         adb_server_port=5037,
                                                         state_detection_rules=None,
                                                         signer=None)
```

Bases: [BaseTVAsync](#), [BaseAndroidTV](#)

Representation of an Android TV device.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **adbkey** (*str*) – The path to the adbkey file for ADB authentication
- **adb_server_ip** (*str*) – The IP address of the ADB server
- **adb_server_port** (*int*) – The port for the ADB server
- **state_detection_rules** (*dict*, *None*) – A dictionary of rules for determining the state (see [BaseTV](#))
- **signer** (*PythonRSASigner*, *None*) – The signer for the ADB keys, as loaded by [androidtv.adb_manager.adb_manager_async.ADBPythonAsync.load_adbkey\(\)](#)

classmethod from_base(*base_tv*)

Construct an *AndroidTVAsync* object from a *BaseTVAsync* object.

Parameters

- **base_tv** ([BaseTVAsync](#)) – The object that will be converted to an *AndroidTVAsync* object

Returns

- **atv** – The constructed *AndroidTVAsync* object

Return type

[AndroidTVAsync](#)

async get_properties(*get_running_apps=True*, *lazy=False*)

Get the properties needed for Home Assistant updates.

Parameters

- **get_running_apps** (*bool*) – Whether or not to get the `running_apps()` property
- **lazy** (*bool*) – Whether or not to continue retrieving properties if the device is off or the screensaver is running

Returns

- **screen_on** (*bool*, *None*) – Whether or not the device is on, or *None* if it was not determined
- **awake** (*bool*, *None*) – Whether or not the device is awake (screensaver is not running), or *None* if it was not determined
- **audio_state** (*str*, *None*) – The audio state, as determined from “dumpsys audio”, or *None* if it was not determined
- **wake_lock_size** (*int*, *None*) – The size of the current wake lock, or *None* if it was not determined
- **current_app** (*str*, *None*) – The current app property, or *None* if it was not determined

- **media_session_state** (*int, None*) – The state from the output of `dumpsys media_session`, or `None` if it was not determined
- **audio_output_device** (*str, None*) – The current audio playback device, or `None` if it was not determined
- **is_volume_muted** (*bool, None*) – Whether or not the volume is muted, or `None` if it was not determined
- **volume** (*int, None*) – The absolute volume level, or `None` if it was not determined
- **running_apps** (*list, None*) – A list of the running apps, or `None` if it was not determined
- **hdmi_input** (*str, None*) – The HDMI input, or `None` if it could not be determined

async get_properties_dict(*get_running_apps=True, lazy=True*)

Get the properties needed for Home Assistant updates and return them as a dictionary.

Parameters

- **get_running_apps** (*bool*) – Whether or not to get the `running_apps()` property
- **lazy** (*bool*) – Whether or not to continue retrieving properties if the device is off or the screensaver is running

Returns

A dictionary with keys 'screen_on', 'awake', 'wake_lock_size', 'current_app', 'media_session_state', 'audio_state', 'audio_output_device', 'is_volume_muted', 'volume', 'running_apps', and 'hdmi_input'

Return type

dict

async update(*get_running_apps=True, lazy=True*)

Get the info needed for a Home Assistant update.

Parameters

- **get_running_apps** (*bool*) – Whether or not to get the `running_apps()` property
- **lazy** (*bool*) – Whether or not to continue retrieving properties if the device is off or the screensaver is running

Returns

- **state** (*str*) – The state of the device
- **current_app** (*str*) – The current running app
- **running_apps** (*list*) – A list of the running apps if `get_running_apps` is `True`, otherwise the list `[current_app]`
- **audio_output_device** (*str*) – The current audio playback device
- **is_volume_muted** (*bool*) – Whether or not the volume is muted
- **volume_level** (*float*) – The volume level (between 0 and 1)

androidtv.androidtv.androidtv_sync module

Communicate with an Android TV device via ADB over a network.

ADB Debugging must be enabled.

```
class androidtv.androidtv.androidtv_sync.AndroidTVSync(host, port=5555, adbkey="",
                                                    adb_server_ip="", adb_server_port=5037,
                                                    state_detection_rules=None, signer=None)
```

Bases: [BaseTVSync](#), [BaseAndroidTV](#)

Representation of an Android TV device.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **adbkey** (*str*) – The path to the adbkey file for ADB authentication
- **adb_server_ip** (*str*) – The IP address of the ADB server
- **adb_server_port** (*int*) – The port for the ADB server
- **state_detection_rules** (*dict*, *None*) – A dictionary of rules for determining the state (see [BaseTV](#))
- **signer** (*PythonRSASigner*, *None*) – The signer for the ADB keys, as loaded by [androidtv.adb_manager.adb_manager_sync.ADBPythonSync.load_adbkey\(\)](#)

classmethod **from_base**(*base_tv*)

Construct an *AndroidTVSync* object from a *BaseTVSync* object.

Parameters

- **base_tv** ([BaseTVSync](#)) – The object that will be converted to an *AndroidTVSync* object

Returns

- **atv** – The constructed *AndroidTVSync* object

Return type

[AndroidTVSync](#)

get_properties(*get_running_apps=True*, *lazy=False*)

Get the properties needed for Home Assistant updates.

Parameters

- **get_running_apps** (*bool*) – Whether or not to get the `running_apps()` property
- **lazy** (*bool*) – Whether or not to continue retrieving properties if the device is off or the screensaver is running

Returns

- **screen_on** (*bool*, *None*) – Whether or not the device is on, or *None* if it was not determined
- **awake** (*bool*, *None*) – Whether or not the device is awake (screensaver is not running), or *None* if it was not determined
- **audio_state** (*str*, *None*) – The audio state, as determined from “dumpsys audio”, or *None* if it was not determined
- **wake_lock_size** (*int*, *None*) – The size of the current wake lock, or *None* if it was not determined

- **current_app** (*str, None*) – The current app property, or *None* if it was not determined
- **media_session_state** (*int, None*) – The state from the output of `dumpsys media_session`, or *None* if it was not determined
- **audio_output_device** (*str, None*) – The current audio playback device, or *None* if it was not determined
- **is_volume_muted** (*bool, None*) – Whether or not the volume is muted, or *None* if it was not determined
- **volume** (*int, None*) – The absolute volume level, or *None* if it was not determined
- **running_apps** (*list, None*) – A list of the running apps, or *None* if it was not determined
- **hdmi_input** (*str, None*) – The HDMI input, or *None* if it could not be determined

get_properties_dict(*get_running_apps=True, lazy=True*)

Get the properties needed for Home Assistant updates and return them as a dictionary.

Parameters

- **get_running_apps** (*bool*) – Whether or not to get the `running_apps()` property
- **lazy** (*bool*) – Whether or not to continue retrieving properties if the device is off or the screensaver is running

Returns

A dictionary with keys 'screen_on', 'awake', 'wake_lock_size', 'current_app', 'media_session_state', 'audio_state', 'audio_output_device', 'is_volume_muted', 'volume', 'running_apps', and 'hdmi_input'

Return type

dict

update(*get_running_apps=True, lazy=True*)

Get the info needed for a Home Assistant update.

Parameters

- **get_running_apps** (*bool*) – Whether or not to get the `running_apps()` property
- **lazy** (*bool*) – Whether or not to continue retrieving properties if the device is off or the screensaver is running

Returns

- **state** (*str*) – The state of the device
- **current_app** (*str*) – The current running app
- **running_apps** (*list*) – A list of the running apps if `get_running_apps` is *True*, otherwise the list [`current_app`]
- **audio_output_device** (*str*) – The current audio playback device
- **is_volume_muted** (*bool*) – Whether or not the volume is muted
- **volume_level** (*float*) – The volume level (between 0 and 1)
- **hdmi_input** (*str, None*) – The HDMI input, or *None* if it could not be determined

androidtv.androidtv.base_androidtv module

Communicate with an Android TV device via ADB over a network.

ADB Debugging must be enabled.

```
class androidtv.androidtv.base_androidtv.BaseAndroidTV(host, port=5555, adbkey="",
                                                         adb_server_ip="", adb_server_port=5037,
                                                         state_detection_rules=None)
```

Bases: [BaseTV](#)

Representation of an Android TV device.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **adbkey** (*str*) – The path to the adbkey file for ADB authentication
- **adb_server_ip** (*str*) – The IP address of the ADB server
- **adb_server_port** (*int*) – The port for the ADB server
- **state_detection_rules** (*dict*, *None*) – A dictionary of rules for determining the state (see [BaseTV](#))

DEVICE_CLASS = 'androidtv'

DEVICE_ENUM = 1

```
_update(screen_on, awake, audio_state, wake_lock_size, current_app, media_session_state,
         audio_output_device, is_volume_muted, volume, running_apps, hdmi_input)
```

Get the info needed for a Home Assistant update.

Parameters

- **screen_on** (*bool*, *None*) – Whether or not the device is on, or *None* if it was not determined
- **awake** (*bool*, *None*) – Whether or not the device is awake (screensaver is not running), or *None* if it was not determined
- **audio_state** (*str*, *None*) – The audio state, as determined from “dumpsys audio”, or *None* if it was not determined
- **wake_lock_size** (*int*, *None*) – The size of the current wake lock, or *None* if it was not determined
- **current_app** (*str*, *None*) – The current app property, or *None* if it was not determined
- **media_session_state** (*int*, *None*) – The state from the output of `dumpsys media_session`, or *None* if it was not determined
- **audio_output_device** (*str*, *None*) – The current audio playback device, or *None* if it was not determined
- **is_volume_muted** (*bool*, *None*) – Whether or not the volume is muted, or *None* if it was not determined
- **volume** (*int*, *None*) – The absolute volume level, or *None* if it was not determined
- **running_apps** (*list*, *None*) – A list of the running apps, or *None* if it was not determined

- **hdmi_input** (*str*, *None*) – The HDMI input, or *None* if it could not be determined

Returns

- **state** (*str*) – The state of the device
- **current_app** (*str*) – The current running app
- **running_apps** (*list*) – A list of the running apps if `get_running_apps` is `True`, otherwise the list [`current_app`]
- **audio_output_device** (*str*) – The current audio playback device
- **is_volume_muted** (*bool*) – Whether or not the volume is muted
- **volume_level** (*float*) – The volume level (between 0 and 1)
- **hdmi_input** (*str*, *None*) – The HDMI input, or *None* if it could not be determined

Module contents

androidtv.basetv package

Submodules

androidtv.basetv.basetv module

Communicate with an Android TV or Amazon Fire TV device via ADB over a network.

ADB Debugging must be enabled.

```
class androidtv.basetv.basetv.BaseTV(adb, host, port=5555, adbkey="", adb_server_ip="",  
                                     adb_server_port=5037, state_detection_rules=None)
```

Bases: `object`

Base class for representing an Android TV / Fire TV device.

The `state_detection_rules` parameter is of the format:

```
state_detection_rules = {'com.amazon.tv.launcher': ['idle'],  
                        'com.netflix.ninja': ['media_session_state'],  
                        'com.ellation.vrv': ['audio_state'],  
                        'com.hulu.plus': [{'playing': {'wake_lock_size': 4}},  
                                         {'paused': {'wake_lock_size': 2}}],  
                        'com.plexapp.android': [{'paused': {'media_session_state':  
→3, 'wake_lock_size': 1}},  
                                                {'playing': {'media_session_state  
→': 3}},  
                                                'idle']}]
```

The keys are app IDs, and the values are lists of rules that are evaluated in order.

VALID_STATES

```
VALID_STATES = ('idle', 'off', 'playing', 'paused', 'standby')
```

Valid rules:

- 'idle', 'playing', 'paused', 'standby', or 'off' = always report the specified state when this app is open
- 'media_session_state' = try to use the `media_session_state()` property to determine the state
- 'audio_state' = try to use the `audio_state()` property to determine the state
- {'<VALID_STATE>': {'<PROPERTY1>': VALUE1, '<PROPERTY2>': VALUE2, ...}} = check if each of the properties is equal to the specified value, and if so return the state
 - The valid properties are 'media_session_state', 'audio_state', and 'wake_lock_size'

Parameters

- **adb** (`ADBPYTHONSync`, `ADBServerSync`, `ADBPYTHONAsync`, `ADBServerAsync`) – The handler for ADB commands
- **host** (`str`) – The address of the device; may be an IP address or a host name
- **port** (`int`) – The device port to which we are connecting (default is 5555)
- **adbkey** (`str`) – The path to the adbkey file for ADB authentication
- **adb_server_ip** (`str`) – The IP address of the ADB server
- **adb_server_port** (`int`) – The port for the ADB server
- **state_detection_rules** (`dict`, `None`) – A dictionary of rules for determining the state (see above)

DEVICE_ENUM = 0

static `_audio_output_device(stream_music)`

Get the current audio playback device from the STREAM_MUSIC block from `adb shell dumpsys audio`.

Parameters

stream_music (`str`, `None`) – The STREAM_MUSIC block from `adb shell dumpsys audio`

Returns

The current audio playback device, or `None` if it could not be determined

Return type

`str`, `None`

static `_audio_state(audio_state_response)`

Parse the `audio_state()` property from the ADB shell output.

Parameters

audio_state_response (`str`, `None`) – The output from the ADB command `androidtv.basetv.basetv.BaseTV._cmd_audio_state`

Returns

The audio state, or `None` if it could not be determined

Return type

`str`, `None`

_cmd_audio_state()

Get the command used to retrieve the current audio state for this device.

Returns

The device-specific ADB shell command used to determine the current audio state

Return type

str

_cmd_current_app()

Get the command used to retrieve the current app for this device.

Returns

The device-specific ADB shell command used to determine the current app

Return type

str

_cmd_current_app_media_session_state()

Get the command used to retrieve the current app and media session state for this device.

Returns

The device-specific ADB shell command used to determine the current app and media session state

Return type

str

_cmd_hdmi_input()

Get the command used to retrieve the current HDMI input for this device.

Returns

The device-specific ADB shell command used to determine the current HDMI input

Return type

str

_cmd_launch_app(app)

Get the command to launch the specified app for this device.

Parameters

app (str) – The app that will be launched

Returns

The device-specific command to launch the app

Return type

str

_cmd_running_apps()

Get the command used to retrieve the running apps for this device.

Returns

The device-specific ADB shell command used to determine the running apps

Return type

str

_cmd_turn_off()

Get the command used to turn off this device.

Returns

The device-specific ADB shell command used to turn off the device

Return type

str

`_cmd_turn_on()`

Get the command used to turn on this device.

Returns

The device-specific ADB shell command used to turn on the device

Return type

str

`_cmd_volume_set(new_volume)`

Get the command used to set volume for this device.

Parameters

new_volume (int) – The new volume level

Returns

The device-specific ADB shell command used to set volume

Return type

str

`static _conditions_are_true(conditions, media_session_state=None, wake_lock_size=None, audio_state=None)`

Check whether the conditions in `conditions` are true.

Parameters

- **conditions** (dict) – A dictionary of conditions to be checked (see the `state_detection_rules` parameter in [BaseTV](#))
- **media_session_state** (int, None) – The `media_session_state()` property
- **wake_lock_size** (int, None) – The `wake_lock_size()` property
- **audio_state** (str, None) – The `audio_state()` property

Returns

Whether or not all the conditions in `conditions` are true

Return type

bool

`static _current_app(current_app_response)`

Get the current app from the output of the command `androidtv.basetv.basetv.BaseTV._cmd_current_app`.

Parameters

current_app_response (str, None) – The output from the ADB command `androidtv.basetv.basetv.BaseTV._cmd_current_app`

Returns

The current app, or None if it could not be determined

Return type

str, None

`_current_app_media_session_state(current_app_media_session_state_response)`

Get the current app and the media session state properties from the output of `androidtv.basetv.basetv.BaseTV._cmd_current_app_media_session_state`.

Parameters

current_app_media_session_state_response (str, None) – The output of `androidtv.basetv.basetv.BaseTV._cmd_current_app_media_session_state`

Returns

- **current_app** (*str*, *None*) – The current app, or *None* if it could not be determined
- **media_session_state** (*int*, *None*) – The state from the output of the ADB shell command, or *None* if it could not be determined

_custom_state_detection(*current_app=None, media_session_state=None, wake_lock_size=None, audio_state=None*)

Use the rules in `self._state_detection_rules` to determine the state.

Parameters

- **current_app** (*str*, *None*) – The `current_app()` property
- **media_session_state** (*int*, *None*) – The `media_session_state()` property
- **wake_lock_size** (*int*, *None*) – The `wake_lock_size()` property
- **audio_state** (*str*, *None*) – The `audio_state()` property

Returns

The state, if it could be determined using the rules in `self._state_detection_rules`; otherwise, *None*

Return type

str, *None*

static _get_hdmi_input(*hdmi_response*)

Get the HDMI input from the from the ADB shell output`.

Parameters

hdmi_response (*str*, *None*) – The output from the ADB command `androidtv.basetv.basetv.BaseTV._cmd_hdmi_input``

Returns

The HDMI input, or *None* if it could not be determined

Return type

str, *None*

static _get_installed_apps(*installed_apps_response*)

Get the installed apps from the output of `androidtv.constants.CMD_INSTALLED_APPS`.

Parameters

installed_apps_response (*str*, *None*) – The output of `androidtv.constants.CMD_INSTALLED_APPS`

Returns

A list of the installed apps, or *None* if it could not be determined

Return type

list, *None*

static _is_volume_muted(*stream_music*)

Determine whether or not the volume is muted from the `STREAM_MUSIC` block from `adb shell dumpsys audio`.

Parameters

stream_music (*str*, *None*) – The `STREAM_MUSIC` block from `adb shell dumpsys audio`

Returns

Whether or not the volume is muted, or None if it could not be determined

Return type

bool, None

`_parse_device_properties(properties)`

Return a dictionary of device properties.

Parameters

- **properties** (*str*, None) – The output of the ADB command that retrieves the device properties
- **attribute** (*This method fills in the device_properties*) –
- **keys** (*which is a dictionary with*) –
- **'serialno'** –
- **'manufacturer'** –
- **'model'** –
- **'sw_version'** (*and*) –

`static _parse_getevent_line(line)`

Parse a line of the output received in `learn_sendevent`.

Parameters

line (*str*) – A line of output from `learn_sendevent`

Returns

The properly formatted `sendevent` command

Return type

str

`static _parse_mac_address(mac_response)`

Parse a MAC address from the ADB shell response.

Parameters

mac_response (*str*, None) – The response from the MAC address ADB shell command

Returns

The parsed MAC address, or None if it could not be determined

Return type

str, None

`static _parse_stream_music(stream_music_raw)`

Parse the output of the command `androidtv.constants.CMD_STREAM_MUSIC`.

Parameters

stream_music_raw (*str*, None) – The output of the command `androidtv.constants.CMD_STREAM_MUSIC`

Returns

The `STREAM_MUSIC` block from the output of `androidtv.constants.CMD_STREAM_MUSIC`, or None if it could not be determined

Return type

str, None

static `_remove_adb_shell_prefix(cmd)`

Remove the ‘adb shell ‘ prefix from `cmd`, if present.

Parameters

cmd (*str*) – The ADB shell command

Returns

`cmd` with the ‘adb shell ‘ prefix removed, if it was present

Return type

str

static `_running_apps(running_apps_response)`

Get the running apps from the output of `androidtv.constants.CMD_RUNNING_APPS`.

Parameters

running_apps_response (*str*, *None*) – The output of `androidtv.constants.CMD_RUNNING_APPS`

Returns

A list of the running apps, or *None* if it could not be determined

Return type

list, *None*

static `_screen_on_awake_wake_lock_size(output)`

Check if the screen is on and the device is awake, and get the wake lock size.

Parameters

output (*str*, *None*) – The output from `androidtv.constants.CMD_SCREEN_ON_AWAKE_WAKE_LOCK_SIZE`

Returns

- *bool*, *None* – Whether or not the device is on, or *None* if it could not be determined
- *bool*, *None* – Whether or not the device is awake (screensaver is not running), or *None* if it could not be determined
- *int*, *None* – The size of the current wake lock, or *None* if it could not be determined

_volume(stream_music, audio_output_device)

Get the absolute volume level from the `STREAM_MUSIC` block from `adb shell dumpsys audio`.

Parameters

- **stream_music** (*str*, *None*) – The `STREAM_MUSIC` block from `adb shell dumpsys audio`
- **audio_output_device** (*str*, *None*) – The current audio playback device

Returns

The absolute volume level, or *None* if it could not be determined

Return type

int, *None*

_volume_level(volume)

Get the relative volume level from the absolute volume level.

Parameters

volume (*int*, *None*) – The absolute volume level

Returns

The volume level (between 0 and 1), or None if it could not be determined

Return type

float, None

static `_wake_lock_size(wake_lock_size_response)`

Get the size of the current wake lock from the output of `androidtv.constants.CMD_WAKE_LOCK_SIZE`.

Parameters

wake_lock_size_response (*str*, None) – The output of `androidtv.constants.CMD_WAKE_LOCK_SIZE`

Returns

The size of the current wake lock, or None if it could not be determined

Return type

int, None

property available

Whether the ADB connection is intact.

Returns

Whether or not the ADB connection is intact

Return type

bool

customize_command(custom_command, value)

Customize a command used to retrieve properties.

Parameters

- **custom_command** (*str*) – The name of the command that will be customized; it must be in `constants.CUSTOMIZABLE_COMMANDS`
- **value** (*str*, None) – The custom ADB command that will be used, or None if the custom command should be deleted

`androidtv.basetv.basetv.state_detection_rules_validator(rules, exc=<class 'KeyError'>)`

Validate the rules (i.e., the `state_detection_rules` value) for a given app ID (i.e., a key in `state_detection_rules`).

For each rule in `rules`, this function checks that:

- rule is a string or a dictionary
- If rule is a string:
 - Check that rule is in `VALID_STATES` or `VALID_STATE_PROPERTIES`
- If rule is a dictionary:
 - Check that each key is in `VALID_STATES`
 - Check that each value is a dictionary
 - * Check that each key is in `VALID_PROPERTIES`
 - * Check that each value is of the right type, according to `VALID_PROPERTIES_TYPES`

See [BaseTV](#) for more info about the `state_detection_rules` parameter.

Parameters

- **rules** (*list*) – A list of the rules that will be used to determine the state
- **exc** (*Exception*) – The exception that will be raised if a rule is invalid

Returns

rules – The provided list of rules

Return type

list

androidtv.basetv.basetv_async module

Communicate with an Android TV or Amazon Fire TV device via ADB over a network.

ADB Debugging must be enabled.

```
class androidtv.basetv.basetv_async.BaseTVAsync(host,port=5555,adbkey="",adb_server_ip="",
adb_server_port=5037,state_detection_rules=None,
signer=None)
```

Bases: *BaseTV*

Base class for representing an Android TV / Fire TV device.

The `state_detection_rules` parameter is of the format:

```
state_detection_rules = {'com.amazon.tv.launcher': ['idle'],
                        'com.netflix.ninja': ['media_session_state'],
                        'com.ellation.vrv': ['audio_state'],
                        'com.hulu.plus': [{'playing': {'wake_lock_size': 4}},
                                           {'paused': {'wake_lock_size': 2}}],
                        'com.plexapp.android': [{'paused': {'media_session_state': 3},
                                                  'wake_lock_size': 1}],
                                                  {'playing': {'media_session_state': 3}},
                                                  {'idle'}}]
```

The keys are app IDs, and the values are lists of rules that are evaluated in order.

VALID_STATES

```
VALID_STATES = ('idle', 'off', 'playing', 'paused', 'standby')
```

Valid rules:

- 'idle', 'playing', 'paused', 'standby', or 'off' = always report the specified state when this app is open
- 'media_session_state' = try to use the `media_session_state()` property to determine the state
- 'audio_state' = try to use the `audio_state()` property to determine the state
- {'<VALID_STATE>': {'<PROPERTY1>': VALUE1, '<PROPERTY2>': VALUE2, ...}} = check if each of the properties is equal to the specified value, and if so return the state
 - The valid properties are 'media_session_state', 'audio_state', and 'wake_lock_size'

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)

- **adbkey** (*str*) – The path to the adbkey file for ADB authentication
- **adb_server_ip** (*str*) – The IP address of the ADB server
- **adb_server_port** (*int*) – The port for the ADB server
- **state_detection_rules** (*dict*, *None*) – A dictionary of rules for determining the state (see above)
- **signer** (*PythonRSASigner*, *None*) – The signer for the ADB keys, as loaded by `androidtv.adb_manager.adb_manager_async.ADBPythonAsync.load_adbkey()`

async _get_stream_music(*stream_music_raw=None*)

Get the `STREAM_MUSIC` block from the output of the command `androidtv.constants.CMD_STREAM_MUSIC`.

Parameters

stream_music_raw (*str*, *None*) – The output of the command `androidtv.constants.CMD_STREAM_MUSIC`

Returns

The `STREAM_MUSIC` block from the output of `androidtv.constants.CMD_STREAM_MUSIC`, or *None* if it could not be determined

Return type

str, *None*

async _key(*key*)

Send a key event to device.

Parameters

key (*str*, *int*) – The Key constant

async _send_intent(*pkg, intent, count=1*)

Send an intent to the device.

Parameters

- **pkg** (*str*) – The command that will be sent is `monkey -p <pkg> -c <intent> <count>; echo $?`
- **intent** (*str*) – The command that will be sent is `monkey -p <pkg> -c <intent> <count>; echo $?`
- **count** (*int*, *str*) – The command that will be sent is `monkey -p <pkg> -c <intent> <count>; echo $?`

Returns

A dictionary with keys 'output' and 'retcode', if they could be determined; otherwise, an empty dictionary

Return type

dict

async adb_close()

Close the ADB connection.

This only works for the Python ADB implementation (see `androidtv.adb_manager.adb_manager_async.ADBPython.close()`). For the ADB server approach, this doesn't do anything (see `androidtv.adb_manager.adb_manager_async.ADBServer.close()`).

async adb_connect(*log_errors=True, auth_timeout_s=10.0, transport_timeout_s=1.0*)

Connect to an Android TV / Fire TV device.

Parameters

- **log_errors** (*bool*) – Whether errors should be logged
- **auth_timeout_s** (*float*) – Authentication timeout (in seconds)
- **transport_timeout_s** (*float*) – Transport timeout (in seconds)

Returns

Whether or not the connection was successfully established and the device is available

Return type

bool

async adb_pull(*local_path, device_path*)

Pull a file from the device.

This calls `androidtv.adb_manager.adb_manager_async.ADBPythonAsync.pull()` or `androidtv.adb_manager.adb_manager_async.ADBServerAsync.pull()`, depending on whether the Python ADB implementation or an ADB server is used for communicating with the device.

Parameters

- **local_path** (*str*) – The path where the file will be saved
- **device_path** (*str*) – The file on the device that will be pulled

async adb_push(*local_path, device_path*)

Push a file to the device.

This calls `androidtv.adb_manager.adb_manager_async.ADBPythonAsync.push()` or `androidtv.adb_manager.adb_manager_async.ADBServerAsync.push()`, depending on whether the Python ADB implementation or an ADB server is used for communicating with the device.

Parameters

- **local_path** (*str*) – The file that will be pushed to the device
- **device_path** (*str*) – The path where the file will be saved on the device

async adb_screenshot()

Take a screenshot.

This calls `androidtv.adb_manager.adb_manager_async.ADBPythonAsync.screenshot()` or `androidtv.adb_manager.adb_manager_async.ADBServerAsync.screenshot()`, depending on whether the Python ADB implementation or an ADB server is used for communicating with the device.

Returns

The screenshot as a binary .png image

Return type

bytes

async adb_shell(*cmd*)

Send an ADB command.

This calls `androidtv.adb_manager.adb_manager_async.ADBPythonAsync.shell()` or `androidtv.adb_manager.adb_manager_async.ADBServerAsync.shell()`, depending on whether the Python ADB implementation or an ADB server is used for communicating with the device.

Parameters

cmd (*str*) – The ADB command to be sent

Returns

The response from the device, if there is a response

Return type

str, *None*

async audio_output_device()

Get the current audio playback device.

Returns

The current audio playback device, or *None* if it could not be determined

Return type

str, *None*

async audio_state()

Check if audio is playing, paused, or idle.

Returns

The audio state, or *None* if it could not be determined

Return type

str, *None*

async awake()

Check if the device is awake (screensaver is not running).

Returns

Whether or not the device is awake (screensaver is not running)

Return type

bool

async back()

Send back action.

async current_app()

Return the current app.

Returns

The ID of the current app, or *None* if it could not be determined

Return type

str, *None*

async current_app_media_session_state()

Get the current app and the state from the output of `dumpsys media_session`.

Returns

- *str*, *None* – The current app, or *None* if it could not be determined
- *int*, *None* – The state from the output of the ADB shell command `dumpsys media_session`, or *None* if it could not be determined

async down()

Send down action.

async enter()

Send enter action.

async get_device_properties()

Return a dictionary of device properties.

Returns

props – A dictionary with keys 'wifimac', 'ethmac', 'serialno', 'manufacturer', 'model', and 'sw_version'

Return type

dict

async get_hdmi_input()

Get the HDMI input from the output of [androidtv.constants.CMD_HDMI_INPUT](#).

Returns

The HDMI input, or None if it could not be determined

Return type

str, None

async get_installed_apps()

Return a list of installed applications.

Returns

A list of the installed apps, or None if it could not be determined

Return type

list, None

async home()

Send home action.

async is_volume_muted()

Whether or not the volume is muted.

Returns

Whether or not the volume is muted, or None if it could not be determined

Return type

bool, None

async key_0()

Send 0 keypress.

async key_1()

Send 1 keypress.

async key_2()

Send 2 keypress.

async key_3()

Send 3 keypress.

async key_4()

Send 4 keypress.

async key_5()

Send 5 keypress.

async key_6()

Send 6 keypress.

async key_7()

Send 7 keypress.

async key_8()

Send 8 keypress.

async key_9()

Send 9 keypress.

async key_a()

Send a keypress.

async key_b()

Send b keypress.

async key_c()

Send c keypress.

async key_d()

Send d keypress.

async key_e()

Send e keypress.

async key_f()

Send f keypress.

async key_g()

Send g keypress.

async key_h()

Send h keypress.

async key_i()

Send i keypress.

async key_j()

Send j keypress.

async key_k()

Send k keypress.

async key_l()

Send l keypress.

async key_m()

Send m keypress.

async key_n()

Send n keypress.

async key_o()

Send o keypress.

async key_p()

Send p keypress.

async key_q()

Send q keypress.

async key_r()

Send r keypress.

async key_s()

Send s keypress.

async key_t()

Send t keypress.

async key_u()

Send u keypress.

async key_v()

Send v keypress.

async key_w()

Send w keypress.

async key_x()

Send x keypress.

async key_y()

Send y keypress.

async key_z()

Send z keypress.

async launch_app(*app*)

Launch an app.

Parameters

app (*str*) – The ID of the app that will be launched

async learn_sendevent(*timeout_s*=8)

Capture an event (e.g., a button press) via `getevent` and convert it into `sendevent` commands.

For more info, see:

- <http://ktnr74.blogspot.com/2013/06/emulating-touchscreen-interaction-with.html?m=1>
- <https://qatesttech.wordpress.com/2012/06/21/turning-the-output-from-getevent-into-something-something-that-can-be>

Parameters

timeout_s (*int*) – The timeout in seconds to wait for events

Returns

The events converted to `sendevent` commands

Return type

str

async left()

Send left action.

async media_next_track()

Send media next action (results in fast-forward).

async media_pause()

Send media pause action.

async media_play()

Send media play action.

async media_play_pause()

Send media play/pause action.

async media_previous_track()

Send media previous action (results in rewind).

async media_session_state()

Get the state from the output of `dumpsys media_session`.

Returns

The state from the output of the ADB shell command `dumpsys media_session`, or `None` if it could not be determined

Return type

int, None

async media_stop()

Send media stop action.

async menu()

Send menu action.

async mute_volume()

Mute the volume.

async power()

Send power action.

async right()

Send right action.

async running_apps()

Return a list of running user applications.

Returns

A list of the running apps

Return type

list

async screen_on()

Check if the screen is on.

Returns

Whether or not the device is on

Return type

bool

async screen_on_awake_wake_lock_size()

Check if the screen is on and the device is awake, and get the wake lock size.

Returns

- *bool* – Whether or not the device is on
- *bool* – Whether or not the device is awake (screensaver is not running)
- *int, None* – The size of the current wake lock, or *None* if it could not be determined

async set_volume_level(volume_level)

Set the volume to the desired level.

Parameters

volume_level (*float*) – The new volume level (between 0 and 1)

Returns

The new volume level (between 0 and 1), or *None* if `self.max_volume` could not be determined

Return type

float, None

async sleep()

Send sleep action.

async space()

Send space keypress.

async start_intent(uri)

Start an intent on the device.

Parameters

uri (*str*) – The intent that will be sent is `am start -a android.intent.action.VIEW -d <uri>`

async stop_app(app)

Stop an app.

Parameters

app (*str*) – The ID of the app that will be stopped

Returns

The output of the `am force-stop` ADB shell command, or *None* if the device is unavailable

Return type

str, None

async stream_music_properties()

Get various properties from the “STREAM_MUSIC” block from `dumpsys audio..`

Returns

- **audio_output_device** (*str, None*) – The current audio playback device, or *None* if it could not be determined
- **is_volume_muted** (*bool, None*) – Whether or not the volume is muted, or *None* if it could not be determined
- **volume** (*int, None*) – The absolute volume level, or *None* if it could not be determined

- **volume_level** (*float, None*) – The volume level (between 0 and 1), or *None* if it could not be determined

async turn_off()

Turn off the device.

async turn_on()

Turn on the device.

async up()

Send up action.

async volume()

Get the absolute volume level.

Returns

The absolute volume level, or *None* if it could not be determined

Return type

int, *None*

async volume_down(current_volume_level=None)

Send volume down action.

Parameters

current_volume_level (*float, None*) – The current volume level (between 0 and 1); if it is not provided, it will be determined

Returns

The new volume level (between 0 and 1), or *None* if `self.max_volume` could not be determined

Return type

float, *None*

async volume_level()

Get the relative volume level.

Returns

The volume level (between 0 and 1), or *None* if it could not be determined

Return type

float, *None*

async volume_up(current_volume_level=None)

Send volume up action.

Parameters

current_volume_level (*float, None*) – The current volume level (between 0 and 1); if it is not provided, it will be determined

Returns

The new volume level (between 0 and 1), or *None* if `self.max_volume` could not be determined

Return type

float, *None*

async wake_lock_size()

Get the size of the current wake lock.

Returns

The size of the current wake lock, or `None` if it could not be determined

Return type

`int`, `None`

androidtv.basetv.basetv_sync module

Communicate with an Android TV or Amazon Fire TV device via ADB over a network.

ADB Debugging must be enabled.

```
class androidtv.basetv.basetv_sync.BaseTVSync(host, port=5555, adbkey="", adb_server_ip="",
                                              adb_server_port=5037, state_detection_rules=None,
                                              signer=None)
```

Bases: *BaseTV*

Base class for representing an Android TV / Fire TV device.

The `state_detection_rules` parameter is of the format:

```
state_detection_rules = {'com.amazon.tv.launcher': ['idle'],
                        'com.netflix.ninja': ['media_session_state'],
                        'com.ellation.vrv': ['audio_state'],
                        'com.hulu.plus': [{'playing': {'wake_lock_size' : 4}},
                                           {'paused': {'wake_lock_size': 2}}],
                        'com.plexapp.android': [{'paused': {'media_session_state': '
↪3, 'wake_lock_size': 1}},
                                                {'playing': {'media_session_state
↪': 3}},
                                                'idle']}]
```

The keys are app IDs, and the values are lists of rules that are evaluated in order.

VALID_STATES

```
VALID_STATES = ('idle', 'off', 'playing', 'paused', 'standby')
```

Valid rules:

- 'idle', 'playing', 'paused', 'standby', or 'off' = always report the specified state when this app is open
- 'media_session_state' = try to use the *media_session_state()* property to determine the state
- 'audio_state' = try to use the *audio_state()* property to determine the state
- {'<VALID_STATE>': {'<PROPERTY1>': VALUE1, '<PROPERTY2>': VALUE2, ...}} = check if each of the properties is equal to the specified value, and if so return the state
 - The valid properties are 'media_session_state', 'audio_state', and 'wake_lock_size'

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **adbkey** (*str*) – The path to the adbkey file for ADB authentication
- **adb_server_ip** (*str*) – The IP address of the ADB server

- **adb_server_port** (*int*) – The port for the ADB server
- **state_detection_rules** (*dict*, *None*) – A dictionary of rules for determining the state (see above)
- **signer** (*PythonRSASigner*, *None*) – The signer for the ADB keys, as loaded by [androidtv.adb_manager.adb_manager_sync.ADBPythonSync.load_adbkey\(\)](#)

_get_stream_music(*stream_music_raw=None*)

Get the STREAM_MUSIC block from the output of the command [androidtv.constants.CMD_STREAM_MUSIC](#).

Parameters

stream_music_raw (*str*, *None*) – The output of the command [androidtv.constants.CMD_STREAM_MUSIC](#)

Returns

The STREAM_MUSIC block from the output of [androidtv.constants.CMD_STREAM_MUSIC](#), or None if it could not be determined

Return type

str, None

_key(*key*)

Send a key event to device.

Parameters

key (*str*, *int*) – The Key constant

_send_intent(*pkg*, *intent*, *count=1*)

Send an intent to the device.

Parameters

- **pkg** (*str*) – The command that will be sent is monkey -p <pkg> -c <intent> <count>; echo \$?
- **intent** (*str*) – The command that will be sent is monkey -p <pkg> -c <intent> <count>; echo \$?
- **count** (*int*, *str*) – The command that will be sent is monkey -p <pkg> -c <intent> <count>; echo \$?

Returns

A dictionary with keys 'output' and 'retcode', if they could be determined; otherwise, an empty dictionary

Return type

dict

adb_close()

Close the ADB connection.

This only works for the Python ADB implementation (see [androidtv.adb_manager.adb_manager_sync.ADBPythonSync.close\(\)](#)). For the ADB server approach, this doesn't do anything (see [androidtv.adb_manager.adb_manager_sync.ADBServerSync.close\(\)](#)).

adb_connect(*log_errors=True*, *auth_timeout_s=10.0*, *transport_timeout_s=1.0*)

Connect to an Android TV / Fire TV device.

Parameters

- **log_errors** (*bool*) – Whether errors should be logged
- **auth_timeout_s** (*float*) – Authentication timeout (in seconds)
- **transport_timeout_s** (*float*) – Transport timeout (in seconds)

Returns

Whether or not the connection was successfully established and the device is available

Return type

bool

adb_pull(*local_path*, *device_path*)

Pull a file from the device.

This calls `androidtv.adb_manager.adb_manager_sync.ADBPythonSync.pull()` or `androidtv.adb_manager.adb_manager_sync.ADBServerSync.pull()`, depending on whether the Python ADB implementation or an ADB server is used for communicating with the device.

Parameters

- **local_path** (*str*) – The path where the file will be saved
- **device_path** (*str*) – The file on the device that will be pulled

adb_push(*local_path*, *device_path*)

Push a file to the device.

This calls `androidtv.adb_manager.adb_manager_sync.ADBPythonSync.push()` or `androidtv.adb_manager.adb_manager_sync.ADBServerSync.push()`, depending on whether the Python ADB implementation or an ADB server is used for communicating with the device.

Parameters

- **local_path** (*str*) – The file that will be pushed to the device
- **device_path** (*str*) – The path where the file will be saved on the device

adb_screencap()

Take a screencap.

This calls `androidtv.adb_manager.adb_manager_sync.ADBPythonSync.screencap()` or `androidtv.adb_manager.adb_manager_sync.ADBServerSync.screencap()`, depending on whether the Python ADB implementation or an ADB server is used for communicating with the device.

Returns

The screencap as a binary .png image

Return type

bytes

adb_shell(*cmd*)

Send an ADB command.

This calls `androidtv.adb_manager.adb_manager_sync.ADBPythonSync.shell()` or `androidtv.adb_manager.adb_manager_sync.ADBServerSync.shell()`, depending on whether the Python ADB implementation or an ADB server is used for communicating with the device.

Parameters

cmd (*str*) – The ADB command to be sent

Returns

The response from the device, if there is a response

Return type

str, None

audio_output_device()

Get the current audio playback device.

Returns

The current audio playback device, or None if it could not be determined

Return type

str, None

audio_state()

Check if audio is playing, paused, or idle.

Returns

The audio state, or None if it could not be determined

Return type

str, None

awake()

Check if the device is awake (screensaver is not running).

Returns

Whether or not the device is awake (screensaver is not running)

Return type

bool

back()

Send back action.

current_app()

Return the current app.

Returns

The ID of the current app, or None if it could not be determined

Return type

str, None

current_app_media_session_state()

Get the current app and the state from the output of `dumpsys media_session`.

Returns

- *str, None* – The current app, or None if it could not be determined
- *int, None* – The state from the output of the ADB shell command `dumpsys media_session`, or None if it could not be determined

down()

Send down action.

enter()

Send enter action.

get_device_properties()

Return a dictionary of device properties.

Returns

props – A dictionary with keys 'wifimac', 'ethmac', 'serialno', 'manufacturer', 'model', and 'sw_version'

Return type

dict

get_hdmi_input()

Get the HDMI input from the output of [androidtv.constants.CMD_HDMI_INPUT](#).

Returns

The HDMI input, or None if it could not be determined

Return type

str, None

get_installed_apps()

Return a list of installed applications.

Returns

A list of the installed apps, or None if it could not be determined

Return type

list, None

home()

Send home action.

is_volume_muted()

Whether or not the volume is muted.

Returns

Whether or not the volume is muted, or None if it could not be determined

Return type

bool, None

key_0()

Send 0 keypress.

key_1()

Send 1 keypress.

key_2()

Send 2 keypress.

key_3()

Send 3 keypress.

key_4()

Send 4 keypress.

key_5()

Send 5 keypress.

key_6()

Send 6 keypress.

key_7()

Send 7 keypress.

key_8()

Send 8 keypress.

key_9()

Send 9 keypress.

key_a()

Send a keypress.

key_b()

Send b keypress.

key_c()

Send c keypress.

key_d()

Send d keypress.

key_e()

Send e keypress.

key_f()

Send f keypress.

key_g()

Send g keypress.

key_h()

Send h keypress.

key_i()

Send i keypress.

key_j()

Send j keypress.

key_k()

Send k keypress.

key_l()

Send l keypress.

key_m()

Send m keypress.

key_n()

Send n keypress.

key_o()

Send o keypress.

key_p()

Send p keypress.

key_q()

Send q keypress.

key_r()

Send r keypress.

key_s()

Send s keypress.

key_t()

Send t keypress.

key_u()

Send u keypress.

key_v()

Send v keypress.

key_w()

Send w keypress.

key_x()

Send x keypress.

key_y()

Send y keypress.

key_z()

Send z keypress.

launch_app(*app*)

Launch an app.

Parameters

app (*str*) – The ID of the app that will be launched

learn_sendevent(*timeout_s*=8)

Capture an event (e.g., a button press) via `getevent` and convert it into `sendevent` commands.

For more info, see:

- <http://ktnr74.blogspot.com/2013/06/emulating-touchscreen-interaction-with.html?m=1>
- <https://qatesttech.wordpress.com/2012/06/21/turning-the-output-from-getevent-into-something-something-that-can-be>

Parameters

timeout_s (*int*) – The timeout in seconds to wait for events

Returns

The events converted to `sendevent` commands

Return type

`str`

left()

Send left action.

media_next_track()

Send media next action (results in fast-forward).

media_pause()

Send media pause action.

media_play()

Send media play action.

media_play_pause()

Send media play/pause action.

media_previous_track()

Send media previous action (results in rewind).

media_session_state()

Get the state from the output of `dumpsys media_session`.

Returns

The state from the output of the ADB shell command `dumpsys media_session`, or `None` if it could not be determined

Return type

`int`, `None`

media_stop()

Send media stop action.

menu()

Send menu action.

mute_volume()

Mute the volume.

power()

Send power action.

right()

Send right action.

running_apps()

Return a list of running user applications.

Returns

A list of the running apps

Return type

`list`

screen_on()

Check if the screen is on.

Returns

Whether or not the device is on

Return type

`bool`

screen_on_awake_wake_lock_size()

Check if the screen is on and the device is awake, and get the wake lock size.

Returns

- *bool* – Whether or not the device is on
- *bool* – Whether or not the device is awake (screensaver is not running)
- *int, None* – The size of the current wake lock, or `None` if it could not be determined

set_volume_level(*volume_level*)

Set the volume to the desired level.

Parameters

volume_level (*float*) – The new volume level (between 0 and 1)

Returns

The new volume level (between 0 and 1), or `None` if `self.max_volume` could not be determined

Return type

float, `None`

sleep()

Send sleep action.

space()

Send space keypress.

start_intent(*uri*)

Start an intent on the device.

Parameters

uri (*str*) – The intent that will be sent is `am start -a android.intent.action.VIEW -d <uri>`

stop_app(*app*)

Stop an app.

Parameters

app (*str*) – The ID of the app that will be stopped

Returns

The output of the `am force-stop` ADB shell command, or `None` if the device is unavailable

Return type

str, `None`

stream_music_properties()

Get various properties from the “STREAM_MUSIC” block from `dumpsys audio..`

Returns

- **audio_output_device** (*str, None*) – The current audio playback device, or `None` if it could not be determined
- **is_volume_muted** (*bool, None*) – Whether or not the volume is muted, or `None` if it could not be determined
- **volume** (*int, None*) – The absolute volume level, or `None` if it could not be determined
- **volume_level** (*float, None*) – The volume level (between 0 and 1), or `None` if it could not be determined

turn_off()

Turn off the device.

turn_on()

Turn on the device.

up()

Send up action.

volume()

Get the absolute volume level.

Returns

The absolute volume level, or `None` if it could not be determined

Return type

int, `None`

volume_down(*current_volume_level=None*)

Send volume down action.

Parameters

current_volume_level (*float*, *None*) – The current volume level (between 0 and 1); if it is not provided, it will be determined

Returns

The new volume level (between 0 and 1), or `None` if `self.max_volume` could not be determined

Return type

float, `None`

volume_level()

Get the relative volume level.

Returns

The volume level (between 0 and 1), or `None` if it could not be determined

Return type

float, `None`

volume_up(*current_volume_level=None*)

Send volume up action.

Parameters

current_volume_level (*float*, *None*) – The current volume level (between 0 and 1); if it is not provided, it will be determined

Returns

The new volume level (between 0 and 1), or `None` if `self.max_volume` could not be determined

Return type

float, `None`

wake_lock_size()

Get the size of the current wake lock.

Returns

The size of the current wake lock, or `None` if it could not be determined

Return type

int, `None`

Module contents

androidtv.firetv package

Submodules

androidtv.firetv.base_firetv module

Communicate with an Amazon Fire TV device via ADB over a network.

ADB Debugging must be enabled.

```
class androidtv.firetv.base_firetv.BaseFireTV(host, port=5555, adbkey="", adb_server_ip="",
                                             adb_server_port=5037, state_detection_rules=None)
```

Bases: [BaseTV](#)

Representation of an Amazon Fire TV device.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **adbkey** (*str*) – The path to the adbkey file for ADB authentication
- **adb_server_ip** (*str*) – The IP address of the ADB server
- **adb_server_port** (*int*) – The port for the ADB server
- **state_detection_rules** (*dict*, *None*) – A dictionary of rules for determining the state (see [BaseTV](#))

```
DEVICE_CLASS = 'firetv'
```

```
DEVICE_ENUM = 2
```

```
_update(screen_on, awake, wake_lock_size, current_app, media_session_state, running_apps, hdmi_input)
```

Get the info needed for a Home Assistant update.

Parameters

- **screen_on** (*bool*, *None*) – Whether or not the device is on, or *None* if it was not determined
- **awake** (*bool*, *None*) – Whether or not the device is awake (screensaver is not running), or *None* if it was not determined
- **wake_lock_size** (*int*, *None*) – The size of the current wake lock, or *None* if it was not determined
- **current_app** (*str*, *None*) – The current app property, or *None* if it was not determined
- **media_session_state** (*int*, *None*) – The state from the output of `dumpsys media_session`, or *None* if it was not determined
- **running_apps** (*list*, *None*) – A list of the running apps, or *None* if it was not determined
- **hdmi_input** (*str*, *None*) – The HDMI input, or *None* if it could not be determined

Returns

- **state** (*str*) – The state of the device
- **current_app** (*str*) – The current running app
- **running_apps** (*list*) – A list of the running apps if `get_running_apps` is `True`, otherwise the list [`current_app`]
- **hdmi_input** (*str, None*) – The HDMI input, or `None` if it could not be determined

androidtv.firetv.firetv_async module

Communicate with an Amazon Fire TV device via ADB over a network.

ADB Debugging must be enabled.

```
class androidtv.firetv.firetv_async.FireTVAsync(host, port=5555, adbkey="", adb_server_ip="",
                                              adb_server_port=5037, state_detection_rules=None,
                                              signer=None)
```

Bases: [BaseTVAsync](#), [BaseFireTV](#)

Representation of an Amazon Fire TV device.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **adbkey** (*str*) – The path to the adbkey file for ADB authentication
- **adb_server_ip** (*str*) – The IP address of the ADB server
- **adb_server_port** (*int*) – The port for the ADB server
- **state_detection_rules** (*dict, None*) – A dictionary of rules for determining the state (see [BaseTV](#))
- **signer** (*PythonRSASigner, None*) – The signer for the ADB keys, as loaded by [androidtv.adb_manager.adb_manager_async.ADBPythonAsync.load_adbkey\(\)](#)

```
classmethod from_base(base_tv)
```

Construct a *FireTVAsync* object from a *BaseTVAsync* object.

Parameters

- **base_tv** ([BaseTVAsync](#)) – The object that will be converted to a *FireTVAsync* object

Returns

ftv – The constructed *FireTVAsync* object

Return type

[FireTVAsync](#)

```
async get_properties(get_running_apps=True, lazy=False)
```

Get the properties needed for Home Assistant updates.

Parameters

- **get_running_apps** (*bool*) – Whether or not to get the `running_apps()` property
- **lazy** (*bool*) – Whether or not to continue retrieving properties if the device is off or the screensaver is running

Returns

- **screen_on** (*bool, None*) – Whether or not the device is on, or *None* if it was not determined
- **awake** (*bool, None*) – Whether or not the device is awake (screensaver is not running), or *None* if it was not determined
- **wake_lock_size** (*int, None*) – The size of the current wake lock, or *None* if it was not determined
- **current_app** (*str, None*) – The current app property, or *None* if it was not determined
- **media_session_state** (*int, None*) – The state from the output of `dumpsys media_session`, or *None* if it was not determined
- **running_apps** (*list, None*) – A list of the running apps, or *None* if it was not determined
- **hdmi_input** (*str, None*) – The HDMI input, or *None* if it could not be determined

async get_properties_dict(*get_running_apps=True, lazy=True*)

Get the properties needed for Home Assistant updates and return them as a dictionary.

Parameters

- **get_running_apps** (*bool*) – Whether or not to get the `running_apps()` property
- **lazy** (*bool*) – Whether or not to continue retrieving properties if the device is off or the screensaver is running

Returns

A dictionary with keys 'screen_on', 'awake', 'wake_lock_size', 'current_app', 'media_session_state', 'running_apps', and 'hdmi_input'

Return type

dict

async update(*get_running_apps=True, lazy=True*)

Get the info needed for a Home Assistant update.

Parameters

- **get_running_apps** (*bool*) – Whether or not to get the `running_apps()` property
- **lazy** (*bool*) – Whether or not to continue retrieving properties if the device is off or the screensaver is running

Returns

- **state** (*str*) – The state of the device
- **current_app** (*str*) – The current running app
- **running_apps** (*list*) – A list of the running apps if `get_running_apps` is *True*, otherwise the list [`current_app`]
- **hdmi_input** (*str, None*) – The HDMI input, or *None* if it could not be determined

androidtv.firetv.firetv_sync module

Communicate with an Amazon Fire TV device via ADB over a network.

ADB Debugging must be enabled.

```
class androidtv.firetv.firetv_sync.FireTVSync(host, port=5555, adbkey="", adb_server_ip="",
                                             adb_server_port=5037, state_detection_rules=None,
                                             signer=None)
```

Bases: [BaseTVSync](#), [BaseFireTV](#)

Representation of an Amazon Fire TV device.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **adbkey** (*str*) – The path to the adbkey file for ADB authentication
- **adb_server_ip** (*str*) – The IP address of the ADB server
- **adb_server_port** (*int*) – The port for the ADB server
- **state_detection_rules** (*dict*, *None*) – A dictionary of rules for determining the state (see [BaseTV](#))
- **signer** (*PythonRSASigner*, *None*) – The signer for the ADB keys, as loaded by [androidtv.adb_manager.adb_manager_sync.ADBPythonSync.load_adbkey\(\)](#)

classmethod **from_base**(*base_tv*)

Construct a *FireTVSync* object from a *BaseTVSync* object.

Parameters

- **base_tv** ([BaseTVSync](#)) – The object that will be converted to a *FireTVSync* object

Returns

- **ftv** – The constructed *FireTVSync* object

Return type

[FireTVSync](#)

get_properties(*get_running_apps=True*, *lazy=False*)

Get the properties needed for Home Assistant updates.

Parameters

- **get_running_apps** (*bool*) – Whether or not to get the `running_apps()` property
- **lazy** (*bool*) – Whether or not to continue retrieving properties if the device is off or the screensaver is running

Returns

- **screen_on** (*bool*, *None*) – Whether or not the device is on, or *None* if it was not determined
- **awake** (*bool*, *None*) – Whether or not the device is awake (screensaver is not running), or *None* if it was not determined
- **wake_lock_size** (*int*, *None*) – The size of the current wake lock, or *None* if it was not determined
- **current_app** (*str*, *None*) – The current app property, or *None* if it was not determined

- **media_session_state** (*int, None*) – The state from the output of `dumpsys media_session`, or `None` if it was not determined
- **running_apps** (*list, None*) – A list of the running apps, or `None` if it was not determined
- **hdmi_input** (*str, None*) – The HDMI input, or `None` if it could not be determined

get_properties_dict(*get_running_apps=True, lazy=True*)

Get the properties needed for Home Assistant updates and return them as a dictionary.

Parameters

- **get_running_apps** (*bool*) – Whether or not to get the `running_apps()` property
- **lazy** (*bool*) – Whether or not to continue retrieving properties if the device is off or the screensaver is running

Returns

A dictionary with keys 'screen_on', 'awake', 'wake_lock_size', 'current_app', 'media_session_state', 'running_apps', and 'hdmi_input'

Return type

dict

update(*get_running_apps=True, lazy=True*)

Get the info needed for a Home Assistant update.

Parameters

- **get_running_apps** (*bool*) – Whether or not to get the `running_apps()` property
- **lazy** (*bool*) – Whether or not to continue retrieving properties if the device is off or the screensaver is running

Returns

- **state** (*str*) – The state of the device
- **current_app** (*str*) – The current running app
- **running_apps** (*list*) – A list of the running apps if `get_running_apps` is `True`, otherwise the list `[current_app]`
- **hdmi_input** (*str, None*) – The HDMI input, or `None` if it could not be determined

Module contents

2.1.2 Submodules

androidtv.constants module

Constants used throughout the code.

Links

dumpsys media_session | grep -A 100 'Sessions Stack' | grep -A 100 $CURRENT_APP | grep -m
1 'state=PlaybackState {'"
```

Determine the current app and get the state from dumpsys media_session for a Google TV device

```
androidtv.constants.CMD_DEFINE_CURRENT_APP_VARIABLE = "CURRENT_APP=$(dumpsys window
windows | grep -E 'mCurrentFocus|mFocusedApp') &&
CURRENT_APP=${CURRENT_APP#*ActivityRecord{* * } && CURRENT_APP=${CURRENT_APP##{* * } &&
CURRENT_APP=${CURRENT_APP%/*} && CURRENT_APP=${CURRENT_APP%\}*}"
```

Assign focused application identifier to CURRENT_APP variable

```
androidtv.constants.CMD_DEFINE_CURRENT_APP_VARIABLE11 = "CURRENT_APP=$(dumpsys window
windows | grep -E -m 1 'mInputMethod(Input)?Target') && CURRENT_APP=${CURRENT_APP%/*} &&
CURRENT_APP=${CURRENT_APP##* }"
```

Assign focused application identifier to CURRENT_APP variable for an Android 11 device

```
androidtv.constants.CMD_DEFINE_CURRENT_APP_VARIABLE12 = "CURRENT_APP=$(dumpsys window
windows | grep -E 'mCurrentFocus|mFocusedApp|mObscuringWindow') &&
CURRENT_APP=${CURRENT_APP%/*} && CURRENT_APP=${CURRENT_APP##* }"
```

Assign focused application identifier to CURRENT_APP variable for an Android 12 device

```
androidtv.constants.CMD_DEFINE_CURRENT_APP_VARIABLE13 = "CURRENT_APP=$(dumpsys window
windows | grep -E -m 1 'imeLayeringTarget|imeInputTarget|imeControlTarget') &&
CURRENT_APP=${CURRENT_APP%/*} && CURRENT_APP=${CURRENT_APP##* }"
```

Assign focused application identifier to CURRENT_APP variable for an Android 13 device

```
androidtv.constants.CMD_DEFINE_CURRENT_APP_VARIABLE_GOOGLE_TV = 'CURRENT_APP=$(dumpsys
activity a . | grep mResumedActivity) && CURRENT_APP=${CURRENT_APP#*ActivityRecord{* * }
&& CURRENT_APP=${CURRENT_APP##{* * } && CURRENT_APP=${CURRENT_APP%/*} &&
CURRENT_APP=${CURRENT_APP%\}*}'
```

Assign focused application identifier to CURRENT_APP variable (for a Google TV device)

```
androidtv.constants.CMD_DEVICE_PROPERTIES = 'getprop ro.product.manufacturer && getprop
ro.product.model && getprop ro.serialno && getprop ro.build.version.release'
```

The command used for getting the device properties

```
androidtv.constants.CMD_HDMI_INPUT = "dumpsys activity starter | grep -E -o
'(ExternalTv|HDMI)InputService/HW[0-9]' -m 1 | grep -o 'HW[0-9]'"
```

Get the HDMI input

```
androidtv.constants.CMD_HDMI_INPUT11 = "(HDMI=$(dumpsys tv_input | grep
'ResourceClientProfile {.*}' | grep -o -E '(hdmi_port=[0-9]|TV)') && { echo
${HDMI}/hdmi_port=/HW | cut -d' ' -f1 ; }) || dumpsys activity starter | grep -E -o
'(ExternalTv|HDMI)InputService/HW[0-9]' -m 1 | grep -o 'HW[0-9]'"
```

Get the HDMI input for an Android 11 device

```
androidtv.constants.CMD_INSTALLED_APPS = 'pm list packages'
```

Get installed apps

```
androidtv.constants.CMD_LAUNCH_APP = "CURRENT_APP=$(dumpsys window windows | grep -E
'mCurrentFocus|mFocusedApp') && CURRENT_APP=${CURRENT_APP#*ActivityRecord{* *}} &&
CURRENT_APP=${CURRENT_APP#*{* *}} && CURRENT_APP=${CURRENT_APP%/*} &&
CURRENT_APP=${CURRENT_APP%\}*} && if [ $CURRENT_APP != '{0}' ]; then monkey -p {0} -c
android.intent.category.LEANBACK_LAUNCHER --pct-syskeys 0 1; fi"
```

Launch an app if it is not already the current app

```
androidtv.constants.CMD_LAUNCH_APP11 = "CURRENT_APP=$(dumpsys window windows | grep -E -m
1 'InputMethod(Input)?Target') && CURRENT_APP=${CURRENT_APP%/*} &&
CURRENT_APP=${CURRENT_APP##*} && if [ $CURRENT_APP != '{0}' ]; then monkey -p {0} -c
android.intent.category.LEANBACK_LAUNCHER --pct-syskeys 0 1; fi"
```

Launch an app if it is not already the current app on an Android 11 device

```
androidtv.constants.CMD_LAUNCH_APP12 = "CURRENT_APP=$(dumpsys window windows | grep -E
'mCurrentFocus|mFocusedApp|mObscuringWindow') && CURRENT_APP=${CURRENT_APP%/*} &&
CURRENT_APP=${CURRENT_APP##*} && if [ $CURRENT_APP != '{0}' ]; then monkey -p {0} -c
android.intent.category.LEANBACK_LAUNCHER --pct-syskeys 0 1; fi"
```

Launch an app if it is not already the current app on an Android 12 device

```
androidtv.constants.CMD_LAUNCH_APP13 = "CURRENT_APP=$(dumpsys window windows | grep -E -m
1 'imeLayeringTarget|imeInputTarget|imeControlTarget') &&
CURRENT_APP=${CURRENT_APP%/*} && CURRENT_APP=${CURRENT_APP##*} && if [ $CURRENT_APP
!= '{0}' ]; then monkey -p {0} -c android.intent.category.LEANBACK_LAUNCHER --pct-syskeys
0 1; fi"
```

Launch an app if it is not already the current app on an Android 11 device

```
androidtv.constants.CMD_LAUNCH_APP_CONDITION = "if [ $CURRENT_APP != '{0}' ]; then monkey
-p {0} -c android.intent.category.LEANBACK_LAUNCHER --pct-syskeys 0 1; fi"
```

Launch an app if it is not already the current app (assumes the variable CURRENT_APP has already been set)

```
androidtv.constants.CMD_LAUNCH_APP_CONDITION_FIRETV = "if [ $CURRENT_APP != '{0}' ]; then
monkey -p {0} -c android.intent.category.LAUNCHER --pct-syskeys 0 1; fi"
```

Launch an app if it is not already the current app (assumes the variable CURRENT_APP has already been set) on a Fire TV

```
androidtv.constants.CMD_LAUNCH_APP_FIRETV = "CURRENT_APP=$(dumpsys window windows | grep
-E 'mCurrentFocus|mFocusedApp') && CURRENT_APP=${CURRENT_APP#*ActivityRecord{* *}} &&
CURRENT_APP=${CURRENT_APP#*{* *}} && CURRENT_APP=${CURRENT_APP%/*} &&
CURRENT_APP=${CURRENT_APP%\}*} && if [ $CURRENT_APP != '{0}' ]; then monkey -p {0} -c
android.intent.category.LAUNCHER --pct-syskeys 0 1; fi"
```

Launch an app on a Fire TV device

```
androidtv.constants.CMD_LAUNCH_APP_GOOGLE_TV = "CURRENT_APP=$(dumpsys activity a . | grep
mResumedActivity) && CURRENT_APP=${CURRENT_APP#*ActivityRecord{* *}} &&
CURRENT_APP=${CURRENT_APP#*{* *}} && CURRENT_APP=${CURRENT_APP%/*} &&
CURRENT_APP=${CURRENT_APP%\}*} && if [ $CURRENT_APP != '{0}' ]; then monkey -p {0} -c
android.intent.category.LEANBACK_LAUNCHER --pct-syskeys 0 1; fi"
```

Launch an app on a Google TV device

```
androidtv.constants.CMD_MEDIA_SESSION_STATE = "dumpsys media_session | grep -A 100
'Sessions Stack' | grep -A 100 $CURRENT_APP | grep -m 1 'state=PlaybackState {'"
```

Get the state from `dumpsys media_session`; this assumes that the variable `CURRENT_APP` has been defined

```
androidtv.constants.CMD_PARSE_CURRENT_APP = 'CURRENT_APP=${CURRENT_APP##*ActivityRecord{*
* } } && CURRENT_APP=${CURRENT_APP##* * } && CURRENT_APP=${CURRENT_APP%/*} &&
CURRENT_APP=${CURRENT_APP%\\}*}'
```

Parse current application identifier from `dumpsys` output and assign it to `CURRENT_APP` variable (assumes `dumpsys` output is momentarily set to `CURRENT_APP` variable)

```
androidtv.constants.CMD_PARSE_CURRENT_APP11 = 'CURRENT_APP=${CURRENT_APP%/*} &&
CURRENT_APP=${CURRENT_APP##* }'
```

Parse current application for an Android 11 device

```
androidtv.constants.CMD_RUNNING_APPS_ANDROIDTV = 'ps -A | grep u0_a'
```

Get the running apps for an Android TV device

```
androidtv.constants.CMD_RUNNING_APPS_FIRETV = 'ps | grep u0_a'
```

Get the running apps for a Fire TV device

```
androidtv.constants.CMD_SCREEN_ON = "(dumpsys power | grep 'Display Power' | grep -q
'state=ON' || dumpsys power | grep -q 'mScreenOn=true' || dumpsys display | grep -q
'mScreenState=ON')"
```

Determine if the device is on

```
androidtv.constants.CMD_SCREEN_ON_AWAKE_WAKE_LOCK_SIZE = "(dumpsys power | grep 'Display
Power' | grep -q 'state=ON' || dumpsys power | grep -q 'mScreenOn=true' || dumpsys
display | grep -q 'mScreenState=ON') && echo -e '1\\c' || echo -e '0\\c' && dumpsys power
| grep mWakefulness | grep -q Awake && echo -e '1\\c' || echo -e '0\\c' && dumpsys power
| grep Locks | grep 'size='"
```

Determine if the device is on, the screen is on, and get the wake lock size

```
androidtv.constants.CMD_STREAM_MUSIC = "dumpsys audio | grep '\\- STREAM_MUSIC:' -A 11"
```

Get the “STREAM_MUSIC” block from `dumpsys audio`

```
androidtv.constants.CMD_TURN_OFF_ANDROIDTV = "(dumpsys power | grep 'Display Power' |
grep -q 'state=ON' || dumpsys power | grep -q 'mScreenOn=true' || dumpsys display | grep
-q 'mScreenState=ON') && input keyevent 26"
```

`KEY_POWER = 26` is defined below)

Type

Turn off an Android TV device (note

```
androidtv.constants.CMD_TURN_OFF_FIRETV = "(dumpsys power | grep 'Display Power' | grep
-q 'state=ON' || dumpsys power | grep -q 'mScreenOn=true' || dumpsys display | grep -q
'mScreenState=ON') && input keyevent 223"
```

`KEY_SLEEP = 223` is defined below)

Type

Turn off a Fire TV device (note

```
androidtv.constants.CMD_TURN_ON_ANDROIDTV = "(dumpsys power | grep 'Display Power' | grep
-q 'state=ON' || dumpsys power | grep -q 'mScreenOn=true' || dumpsys display | grep -q
'mScreenState=ON') || input keyevent 26"
```

KEY_POWER = 26 is defined below)

Type

Turn on an Android TV device (note

```
androidtv.constants.CMD_TURN_ON_FIRETV = "(dumpsys power | grep 'Display Power' | grep -q
'state=ON' || dumpsys power | grep -q 'mScreenOn=true' || dumpsys display | grep -q
'mScreenState=ON') || (input keyevent 26 && input keyevent 3)"
```

KEY_POWER = 26 and *KEY_HOME = 3* are defined below)

Type

Turn on a Fire TV device (note

```
androidtv.constants.CMD_VOLUME_SET_COMMAND = 'media volume --show --stream 3 --set {}'
set volume
```

```
androidtv.constants.CMD_VOLUME_SET_COMMAND11 = 'cmd media_session volume --show --stream
3 --set {}'
```

set volume for an Android 11 & 12 & 13 device

```
androidtv.constants.CMD_WAKE_LOCK_SIZE = "dumpsys power | grep Locks | grep 'size='"
```

Get the wake lock size

```
androidtv.constants.DEFAULT_ADB_TIMEOUT_S = 9.0
```

Default timeout (in s) for adb_shell.handle.tcp_handle.TcpHandle and adb_shell.handle.tcp_handle_async.TcpHandleAsync

```
androidtv.constants.DEFAULT_AUTH_TIMEOUT_S = 10.0
```

Default authentication timeout (in s) for adb_shell.handle.tcp_handle.TcpHandle.connect() and adb_shell.handle.tcp_handle_async.TcpHandleAsync.connect()

```
androidtv.constants.DEFAULT_LOCK_TIMEOUT_S = 3.0
```

Default timeout for acquiring the lock that protects ADB commands

```
androidtv.constants.DEFAULT_TRANSPORT_TIMEOUT_S = 1.0
```

Default transport timeout (in s) for adb_shell.handle.tcp_handle.TcpHandle.connect() and adb_shell.handle.tcp_handle_async.TcpHandleAsync.connect()

```
class androidtv.constants.DeviceEnum(value, names=None, *, module=None, qualname=None, type=None,
start=1, boundary=None)
```

Bases: IntEnum

An enum for the various device types.

```
ANDROIDTV = 1
```

```
BASETV = 0
```

```
FIRETV = 2
```

```
androidtv.constants.HA_CUSTOMIZABLE_COMMANDS = ('audio_state',
'current_app_media_session_state', 'hdmi_input', 'launch_app', 'running_apps',
'turn_off', 'turn_on')
```

The subset of *CUSTOMIZABLE_COMMANDS* that is potentially used in the update() method

```
androidtv.constants.MEDIA_SESSION_STATES = {0: None, 1: 'stopped', 2: 'paused', 3:
'playing'}
```

States for the media_session_state property

```
androidtv.constants.VALID_PROPERTIES = ('audio_state', 'media_session_state',
'wake_lock_size')
```

Properties that can be checked for custom state detection (used by `state_detection_rules_validator()`)

```
androidtv.constants.VALID_PROPERTIES_TYPES = {'audio_state': <class 'str'>,
'media_session_state': <class 'int'>, 'wake_lock_size': <class 'int'>}
```

The required type for each entry in `VALID_PROPERTIES` (used by `state_detection_rules_validator()`)

```
androidtv.constants.VALID_STATES = ('idle', 'off', 'playing', 'paused', 'standby')
```

States that are valid (used by `state_detection_rules_validator()`)

```
androidtv.constants.VALID_STATE_PROPERTIES = ('audio_state', 'media_session_state')
```

Properties that can be used to determine the current state (used by `state_detection_rules_validator()`)

androidtv.exceptions module

Exceptions for use throughout the code.

exception `androidtv.exceptions.LockNotAcquiredException`

Bases: `Exception`

The ADB lock could not be acquired.

androidtv.setup_async module

Connect to a device and determine whether it's an Android TV or an Amazon Fire TV.

ADB Debugging must be enabled.

```
async androidtv.setup_async.setup(host, port=5555, adbkey="", adb_server_ip="", adb_server_port=5037,
state_detection_rules=None, device_class='auto', auth_timeout_s=10.0,
signer=None, transport_timeout_s=1.0, log_errors=True)
```

Connect to a device and determine whether it's an Android TV or an Amazon Fire TV.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **adbkey** (*str*) – The path to the adbkey file for ADB authentication
- **adb_server_ip** (*str*) – The IP address of the ADB server
- **adb_server_port** (*int*) – The port for the ADB server
- **state_detection_rules** (*dict*, *None*) – A dictionary of rules for determining the state (see [BaseTV](#))
- **device_class** (*str*) – The type of device: 'auto' (detect whether it is an Android TV or Fire TV device), 'androidtv', or 'firetv'
- **auth_timeout_s** (*float*) – Authentication timeout (in seconds)
- **signer** (*PythonRSASigner*, *None*) – The signer for the ADB keys, as loaded by [androidtv.adb_manager.adb_manager_async.ADBPythonAsync.load_adbkey\(\)](#)
- **transport_timeout_s** (*float*) – Transport timeout (in seconds)
- **log_errors** (*bool*) – Whether connection errors should be logged

Returns

The representation of the device

Return type

AndroidTVAsync, FireTVAsync

2.1.3 Module contents

Connect to a device and determine whether it's an Android TV or an Amazon Fire TV.

ADB Debugging must be enabled.

`androidtv.ha_state_detection_rules_validator(exc)`

Validate the rules (i.e., the `state_detection_rules` value) for a given app ID (i.e., a key in `state_detection_rules`).

See [BaseTV](#) for more info about the `state_detection_rules` parameter.

Parameters

exc (*Exception*) – The exception that will be raised if a rule is invalid

Returns

wrapped_state_detection_rules_validator – A function that is the same as `state_detection_rules_validator()`, but with the `exc` argument provided

Return type

function

`androidtv.setup(host, port=5555, adbkey="", adb_server_ip="", adb_server_port=5037, state_detection_rules=None, device_class='auto', auth_timeout_s=10.0, signer=None, transport_timeout_s=1.0, log_errors=True)`

Connect to a device and determine whether it's an Android TV or an Amazon Fire TV.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **adbkey** (*str*) – The path to the adbkey file for ADB authentication
- **adb_server_ip** (*str*) – The IP address of the ADB server
- **adb_server_port** (*int*) – The port for the ADB server
- **state_detection_rules** (*dict, None*) – A dictionary of rules for determining the state (see [BaseTV](#))
- **device_class** (*str*) – The type of device: 'auto' (detect whether it is an Android TV or Fire TV device), 'androidtv', or 'firetv'
- **auth_timeout_s** (*float*) – Authentication timeout (in seconds)
- **signer** (*PythonRSASigner, None*) – The signer for the ADB keys, as loaded by `androidtv.adb_manager.adb_manager_sync.ADBPythonSync.load_adbkey()`
- **transport_timeout_s** (*float*) – Transport timeout (in seconds)
- **log_errors** (*bool*) – Whether connection errors should be logged

Returns

The representation of the device

Return type

AndroidTVSync, FireTVSync

INSTALLATION

```
pip install androidtv
```

To utilize the async version of this code, you must install into a Python 3.7+ environment via:

```
pip install androidtv[async]
```
